## **Aqua Fast Dry System**

*Drying Aquabase in four minutes*

***Innovating Repair Solutions***

## The system

**The Aqua Fast Dry System is a vertical drying system of compressed air which doubles the air volume in the spraying cabin, without this affecting the quality of the work. The system is also simple to use.**

### Vertical drying

There are 6 venturis on each side of the spraying cabin which blow compressed air to various points set by the sprayer.

This avoids turbulence in the spraying cabin, therefore removing the risk of dust being circulated.

### Regulation of the system

The Aqua Fast Dry System is simple to use, you need only set the drying time and the required cabin temperature. The opening of the venturis can also be set.

It is not only possible to direct the venturis to the left or right but also to bend them, as shown in the photo to the right.

### Double air volume

The volume of air in the spraying cabin is double thanks to an air circulation system which reduces the drying time considerably.

## The advantages

- **Important time savings**, because this system dries a water based paint such as Aquabase in approximately 4 minutes, which is ten minutes shorter than without this system.
- **Considerable energy savings** due to the fact that the spraying cabin need not be heated up for (minor) repairs.
- **Money savings**, not only because the sprayer in the cabin is no longer hindered by the blower but also because of the energy saved.
