

-Salem Blue Pad Reduces Trivex Costs

CHARLOTTESVILLE, Va.-Salem's new Blue -One Step combines a one-step fining pad with a polishing pad that, when used as a system, can increase production while reducing production costs for processing Trivex lenses.

It was developed utilizing state-of-the-art abrasive engineering and bonding technologies to provide elevated stock removal rates without the course surface finish associated with conventional one step pads.

Also from Salem comes the Opti-Yellow pad and Elite polish. The Opti-Yellow polishing pad is designed to yield a bright surface finish. The nap structure is dense and erect, resulting in a vigorous polishing action. -The Opti-yellow polishing pad is constructed on the new "space age" backing that offers easy pad removal and consistent thickness.

The Elite is a reasonably priced polish recommended for labs that require high stock removal and excellent surface quality on all plastic lens materials. This polish is strongly suited for labs processing AR lenses. E

Salem Blue One Step Pads reduce Trivex lens-processing costs.
